

# Chapter 1. Preference and Choice

Xiaoxiao Hu

September 2, 2019

## 1.A. Introduction

Two approaches to modeling individual choice behavior:

1. Preference-based Approach: preference as primitive (rationality axioms)  $\implies$  consequences on choices
2. Choice-based Approach: choice behavior as primitive (axioms on behavior)

## 1.B. Preference Relations

$X$ : Set of Alternatives.

- For example, if Alice just graduated from Wuhan University majoring in economics, then her set of alternatives is:  
 $X = \{\text{go to graduate school and study economics, go to a Big-4 firm, go to work for the government, ..., run a small business}\}.$

We use capital letters (like  $X$  and  $B$ ) for a set of alternatives, small letters (like  $x$  and  $y$ ) for a specific choice alternative.

## Defining Preference Relations

Denote by  $\succsim$  the *preference relation* defined on the set  $X$ , allowing the comparison of any  $x$  and  $y$  in  $X$ .

- $x \succsim y$ : pronounced as “ $x$  is preferred to  $y$ ” or “ $x$  is at least as good as  $y$ .” The first usage is more common.
- *Strict preference*  $\succ$ :  $x \succ y \iff x \succsim y$  but not  $y \succsim x$  (i.e.,  $y \not\succsim x$ ) (“ $x$  is strictly preferred to  $y$ .”)
- *Indifference*  $\sim$ :  $x \sim y \iff x \succsim y$  and  $y \succsim x$  (“ $x$  is indifferent to  $y$ .”)

## Rational Preference

Not all preference relations make sense.

For example, consider Alice's preference:

- “Hot and Dry Noodles”  $\succ$  “Doupi” (dòu pí)
- “Doupi”  $\succ$  “Xiaolongbao” (xiǎo lóng bāo)
- “Xiaolongbao”  $\succsim$  “Hot and Dry Noodles”

Alice must have a hard time choosing her breakfast from

$X = \{\text{Hot and Dry Noodles, Doupi, Xiaolongbao}\}.$

## Rational Preference

**Definition 1.B.1** (Rational preference). The preference relation  $\succsim$  is **rational** if it possesses these two properties:

(i) Completeness:  $\forall x, y \in X$ ,  $x \succsim y$  or  $y \succsim x$ . (rules out

$x \not\succsim y$  and  $y \not\succsim x$ )

(ii) Transitivity:  $\forall x, y, z \in X$ , if  $x \succsim y$  and  $y \succsim z$ , then

$x \succsim z$ .

## Rational Preference

*Question.* In the example above, which property does Alice's preference relation violate?

## Rational Preference

*Question.* In the example above, which property does Alice's preference relation violate?

*Answer: Transitivity.*

The first two bullet points

- “Hot and Dry Noodles”  $\succ$  “Doupi” (dòu pí)
- “Doupi”  $\succ$  “Xiaolongbao” (xiǎo lóng bāo)

implies “Hot and Dry Noodles”  $\succ$  “Xiaolongbao”

which contradicts “Xiaolongbao”  $\succsim$  “Hot and Dry Noodles”

## Implications of Rational Preference on $\succ$ and $\sim$

The following propositions follow from the definition of *rational preference*.

**Proposition 1.B.1.** *If  $\succsim$  is rational, then:*

- (i)  $\succ$  is both irreflexive ( $x \succ x$  never holds) and transitive.*
- (ii)  $\sim$  is reflexive ( $x \sim x$ ), transitive and symmetric (if  $x \sim y$ , then  $y \sim x$ ).*
- (iii) if  $x \succ y \succsim z$ , then  $x \succ z$ . (slightly stronger than transitivity in (i))*

## Utility Functions

**Definition 1.B.2.** A function  $u : X \rightarrow \mathbb{R}$  is a utility function representing preference relation  $\succsim$  if

$$x \succsim y \iff u(x) \geq u(y) \text{ for all } x, y \in X. \quad (1)$$

The utility function is nothing but assigning each choice  $x$  with a number  $u(x)$ . Obviously, the function  $u$  satisfying Condition (1) is not unique.

**Example.**  $u(x) \geq u(y) \iff \alpha u(x) \geq \alpha u(y)$  for all  $\alpha > 0$ .

## Utility Functions

**Exercise.** Show that if  $f : \mathbb{R} \rightarrow \mathbb{R}$  is a **strictly increasing** function and  $u : X \rightarrow \mathbb{R}$  is a utility function representing preference relation  $\succsim$ , then the function  $v : X \rightarrow \mathbb{R}$  defined by  $v(x) = f(u(x))$  is also a utility function representing preference relation  $\succsim$ .

## Utility Functions

*Question.* When can a preference relation be represented by a utility function?

## Utility Functions

*Question.* When can a preference relation be represented by a utility function?

*Answer:* Only if the preference relation is rational. See the next proposition.

## Utility Functions

**Proposition 1.B.2.** *If the preference relation  $\succsim$  can be represented by a utility function (i.e.  $\exists u(\cdot)$  s.t.  $u(x) \geq u(y)$  iff  $x \succsim y$ ), then  $\succsim$  is rational (i.e. complete & transitive).*

## Utility Functions

*Question.* If  $\succsim$  is rational, does there exist a utility function  $u$  representing  $\succsim$  ?

## Utility Functions

*Question.* If  $\succsim$  is rational, does there exist a utility function  $u$  representing  $\succsim$  ?

*Answer:* Not always. Rationality is just a necessary condition for the existence of a utility representation, but not sufficient. See the counterexample below.

## Lexicographic Preference

**Definition** (Lexicographic Preference). Let  $X = \mathbb{R}^2$ . The preference relation  $\succsim$  is a *lexicographic preference* if for all  $x, y \in X$ ,  $x \succsim y$  whenever (i)  $x_1 > y_1$  or (ii)  $x_1 = y_1$  and  $x_2 \geq y_2$ .

**Claim.** The lexicographic preference on  $\mathbb{R}^2$  do *not* have a utility representation.

## Example of Lexicographic Preference

Alice is considering buying a new phone. The relevant attributes include brand name, price, CPU, and so on. For simplicity, suppose Alice only cares about the brand (Apple or Huawei) and price. Alice is a Apple fan and strictly prefers an iPhone to a Huawei Phone regardless of the price. For Alice,

$$(\text{Apple}, 5000) \succ (\text{Apple}, 8000) \succ (\text{Huawei}, 5000).$$

## Utility Function

*Remark.* If  $X$  is **finite** and  $\succsim$  is a rational preference relation on  $X$ , then there is a utility function  $u : X \rightarrow \mathbb{R}$  that represents  $\succsim$ .

## 1.C. Choice Rules

A *choice structure*  $(\mathcal{B}, C(\cdot))$  consists of two ingredients:

(i)  $\mathcal{B}$  is a family (a set) of nonempty subsets of  $X$ : that is, every  $B \in \mathcal{B}$  is a set  $B \in X$ .

- In consumer theory,  $B$  are budget sets.
- $\mathcal{B}$  needs NOT to include all possible subsets of  $X$ .

(ii)  $C(\cdot)$  is a choice rule that assigns a nonempty subset of chosen elements  $C(B) \subset B$  for every  $B \in \mathcal{B}$ .

- $C(B)$  is a set of *acceptable alternatives*.

## Choice Rules

**Example 1.C.1.**  $X = \{x, y, z\}, \mathcal{B} = \{\{x, y\}, \{x, y, z\}\}$

Choice Structure 1  $(\mathcal{B}, C_1(\cdot))$ :

$$C_1(\{x, y\}) = \{x\}, C_1(\{x, y, z\}) = \{x\}$$

Choice Structure 2  $(\mathcal{B}, C_2(\cdot))$ :

$$C_2(\{x, y\}) = \{x\}, C_2(\{x, y, z\}) = \{x, y\}$$

Under  $(\mathcal{B}, C_2(\cdot))$ ,  $y$  is acceptable only if  $z$  is available.

## Choice Rules

You might find the choice structure 2 unreasonable.

Consider the following conversation.

Waiter: Coffee or Tea?

Customer: Coffee, please.

Waiter: Sure. Oh sorry, actually we also serve coke. Do you want some coke?

Customer: *Since coke is available, I'd prefer tea rather than coffee.*

## Weak Axiom of Revealed Preference (W.A.R.P)

**Definition 1.C.1.** The choice structure  $(\mathcal{B}, C(\cdot))$  satisfies the weak axiom of revealed preference (W.A.R.P) if the following property holds:

If for some  $B \in \mathcal{B}$  with  $x, y \in B$  we have  $x \in C(B)$ , then for any  $B' \in \mathcal{B}$  with  $x, y \in B'$  and  $y \in C(B')$ , we must also have  $x \in C(B')$ .

## Weak Axiom of Revealed Preference (W.A.R.P)

In the last example,  $(\mathcal{B}, C_2(\cdot))$  violates W.A.R.P since

$y \in C_2(\{x, y, z\})$ ,  $x, y \in \{x, y\}$ ,  $x \in C_2(\{x, y\})$  but

$y \notin C_2(\{x, y\})$ .

[Think of  $\{x, y, z\}$  as  $B$  and  $\{x, y\}$  as  $B'$  in Definition 1.C.1.]

IDEA: Agent's choice between  $x$  and  $y$  should not be affected by irrelevant options/alternatives.

## Revealed Preference: Preference inferred from/ revealed through Choice

**Definition 1.C.2.** Given a choice structure  $(\mathcal{B}, C(\cdot))$ , the **revealed preference relation**  $\succsim^*$  is defined by

$$x \succsim^* y \iff \exists B \in \mathcal{B} \text{ s.t. } x, y \in B \text{ and } x \in C(B).$$

$x \succsim^* y$  reads “ $x$  is revealed at least as good as  $y$ ”

## Revealed Preference

- $x \succ^* y$ :

$\exists B \in \mathcal{B}$  s.t.  $x, y \in B$  and  $x \in C(B)$ , and  $y \notin C(B)$ . (

“ $x$  is revealed preferred to  $y$ ”)

- $\succ^*$  needs not to be complete or transitive.
- “Revealed preference” is defined reference to  $B$ .  
(Compare with “preference”)
- **Restatement of W.A.R.P:** If  $x \succ^* y$ , then  $y \not\succ^* x$ .  
(only imposed on  $B \in \mathcal{B}$ )

## Revealed Preference

**Example 1.C.2.** Recall Example 1.C.1.

$(\mathcal{B}, C_1(\cdot))$ :  $x \succ^* y$  and  $x \succ^* y, x \succ^* z$

$(\mathcal{B}, C_2(\cdot))$ :  $x \succ^* y$  and  $y \succsim^* x \implies$  contradicts W.A.R.P

## Useful alternative statements of W.A.R.P

**Restatement of W.A.R.P 1.**  $x, y \in B, x \in C(B),$   
 $y \in C(B') \ \& \ x \notin C(B'),$  then  $x \notin B'.$

**Proof.** Proof by contradiction. If  $x \in B' \ \& \ y \in C(B'),$

W.A.R.P  $\implies x \in C(B').$  □

**Restatement of W.A.R.P 2.** Suppose that  $B, B' \in \mathcal{B},$  that  
 $x, y \in B,$  and that  $x, y \in B'.$  Then if  $x \in C(B)$  and  
 $y \in C(B'),$  we must have  $\{x, y\} \subset C(B)$  and  $\{x, y\} \in C(B').$

The proof is left as an exercise.

## 1.D. Relationship between Preference Relations & Choice Rules

More precisely, we want to know the relationship between *rational preference* and *W.A.R.P.*

(i) Does Rational Preference imply W.A.R.P?

(ii) Does W.A.R.P imply Rational Preference?

## 1.D. Relationship between Preference Relations & Choice Rules

More precisely, we want to know the relationship between *rational preference* and *W.A.R.P.*

(i) Does Rational Preference imply W.A.R.P? (Yes)

(ii) Does W.A.R.P imply Rational Preference? (Maybe)

## Preference Generated Choice Structure

Consider rational preference  $\succsim$  on  $X$ .

Define:  $C^*(B, \succsim) = \{x \in B: x \succsim y \text{ for every } y \in B\}$

- Elements of  $C^*(B, \succsim)$  are DM's most preferred alternatives in  $B$ .
- Assumption:  $C^*(B, \succsim)$  is nonempty for all  $B \in \mathcal{B}$ .

*Remark.* If  $X$  is **finite**, then any rational preference relation generates a nonempty choice rule.

The proof is left as an exercise.

## Preference Generated Choice Structure

We say that the preference  $\succsim$  *generates* the choice structure  $(\mathcal{B}, C^*(\cdot, \succsim))$ .

**Proposition 1.D.1.** *Suppose  $\succsim$  is a rational preference relation. Then the choice structure generated by  $\succsim$ ,  $(\mathcal{B}, C^*(\cdot, \succsim))$  satisfies W.A.R.P.*

## Preference Generated Choice Structure

**Definition 1.D.1.** Given a choice structure  $(\mathcal{B}, C(\cdot))$ , we say that the rational preference relation  $\succsim$  rationalizes  $C(\cdot)$  relative to  $\mathcal{B}$  if  $C(B) = (C^*(B, \succsim))$  for all  $B \in \mathcal{B}$ , that is, if  $\succsim$  generates the choice structure  $(\mathcal{B}, C(\cdot))$ .

## Preference Generated Choice Structure

1. If a rational preference relation rationalizes the choice rule, we can interpret the DM's choices as if she were a preference maximizer.
2. In general, there may be more than one rationalizing preference relation  $\succsim$  for a given choice structure  $(\mathcal{B}, C(\cdot))$ .

### **Example.**

$$X = \{x, y\}, \mathcal{B} = \{\{x\}, \{y\}\}, C(\{x\}) = x, C(\{y\}) = y.$$

## Preference Generated Choice Structure

**Example 1.D.1.**  $X = \{x, y, z\}$ ,

$$\mathcal{B} = \{\{x, y\}, \{y, z\}, \{x, z\}\}^1,$$

$$C(\{x, y\}) = \{x\}, C(\{y, z\}) = \{y\}, C(\{x, z\}) = \{z\}.$$

*This choice structure satisfies the W.A.R.P.*

*However, it cannot be rationalized by a rational preference.*

*Remark.* W.A.R.P is defined by  $\mathcal{B}$ . And the choice is not challenged by having to choose from  $\{x, y, z\}$ .

---

<sup>1</sup> $\{x, y, z\}$  is not empirically relevant.

## Preference Generated Choice Structure

**Proposition 1.D.2.** *If  $(\mathcal{B}, C(\cdot))$  is a choice structure such that*

*(i) the W.A.R.P is satisfied,  $[x \succsim^* y, \text{ then } y \not\succ^* x]$*

*(ii)  $\mathcal{B}$  includes all subsets of  $X$  of up to three elements,*

*then  $\exists$  rational  $\succsim$  that rationalizes  $C(\cdot)$  relative to  $\mathcal{B}$ , i.e.,*

$$C(B) = (C^*(B, \succsim)), \forall B \in \mathcal{B}.$$

*Furthermore, this rational preference relation is unique.*

## Summary of Chapter 1

- Preference relation  $\succsim$  is binary relation on choice set  $X$ .
- $\succsim$  is rational if Completeness & Transitivity.
- Choice function  $C(\cdot)$  is defined on  $\mathcal{B}$ , NOT on  $X$ .  
(Assumptions: W.A.R.P &  $C(\cdot) \neq \emptyset$ )
- Rational Preference implies W.A.R.P.

But for W.A.R.P to imply Rational Preference, it requires  $C(\cdot) \neq \emptyset$  and that  $\mathcal{B}$  includes all 2 & 3-element subsets of  $X$ .
